

Waypoint — Festival Connectivity Partner

Connectivity that survives the crowd.

What we do

We help festival organizers and rental partners deliver reliable on-site connectivity so fans can find each other, message even when LTE is congested, and enjoy supplemental high-bandwidth internet for uploads, streams, and transactions.

Solutions

- 1) Friend-Finding & Crew Messaging — Direction-finding devices and mesh messaging that work under heavy cellular congestion.
- 2) Temporary Festival Internet — Rapid backhaul (e.g., satellite or licensed microwave) distributed via pop-up Wi-Fi/HaLow nodes.
- 3) Ops & Safety Comms — Staff channels, SOS, and rendezvous tooling that complements existing radios, CCTV, and COWs (Cells on Wheels).

How it works (at a glance)

Backhaul (satellite / microwave / fiber)

→ Waypoint Nodes (Wi-Fi/HaLow, battery or mains powered)

→ Guests & Staff Devices (friend-finding, messaging, payments, content).

Pilot program

We are running limited pilots with select festivals. We provide a rapid site survey, capacity plan, and an on-site deployment kit. Primary KPIs: shorter reunion times, fewer “no signal” complaints, higher throughput for guest Wi-Fi and PoS.

The Compass module

A guest-experience add-on that provides live direction-finding between friends and offline messaging when LTE is jammed. Status: pilot only / coming soon.

Why organizers choose Waypoint

- Designed to work alongside carriers’ COWs/DAS and existing radios.
- Modular: rent via partners or contract Waypoint directly.
- Practical: planning, deployment, and dashboards packaged for events.
